statements & categories

— [134 statements collected from 79 experts in an online brainstorm

— [lumping into higher-order categories, to make things more manageable

— [not by priority, not by importance, but by conceptual similarity

— [also, name the clusters in a meaningful way

How: card sorting

— [card sorting individually online (no iPad, uses Flash)

— [tonight: create a 'wisdom of the crowds' view on your work

— [a hierarchical ordering, input for our discussion

— [cf. the way biologists group species into genera into families .. (we do not use names for levels though)

Some tips

- [Do the sorting at once, no saving options are available.
- [When finished sorting click on the button “I’m done”.
- [Minimize the groups if too many groups or group lists are too long.

Some more tips

— [Only drop a statement into a group when the border of the group is highlighted, otherwise it can go to other group. If it happens, do not worry, you can always put it at the right place. You can also move statements from one group to another. You might need to move the groups (minimized) around to make some more space.

— [If you are using IE, click the compatibility button **before** you start (sits in address bar on the top)
